About

Typography

Documentation and examples for Bootstrap typography, including global settings, headings, body text, lists, and more.

Global settings

Bootstrap sets basic global display, typography, and link styles. When more control is needed, check out the [textual utility classes](#).

- Use a [native font stack](#) that selects the best `font-family` for each OS and device.
- For a more inclusive and accessible type scale, we assume the browser default root `font-size` (typically 16px) so visitors can customize their browser defaults as needed.
- Use the `$font-family-base`, `$font-size-base`, and `$line-height-base` attributes as our typographic base applied to the `<body>`.
- Set the global link color via `$link-color` and apply link underlines only on `:hover`.
- Use `$body-bg` to set a `background-color` on the `<body>` (`#fff` by default).

These styles can be found within `_reboot.scss`, and the global variables are defined in `_variables.scss`. Make sure to set `$font-size-base` in `rem`.

Headings

All HTML headings, `<h1>` through `<h6>`, are available.

Heading	Example
<code><h1></h1></code>	<h1>Bootstrap heading</h1>
<code><h2></h2></code>	<h2>Bootstrap heading</h2>
